

ABSTRACT

A worker uses a remote controller (80) to provide an instruction, so as to turn on signal output from a microcomputer (67) of a video transmitting unit (20) to be inspected to an antenna. For the video transmitting unit (20) and a display unit (30) paired with the video transmitting unit (20) in an inspection line, the worker selects an antenna to be inspected, with the use of the remote controller (80). In short, the worker selects an antenna to be functioned. At this time the worker selects at least one antenna in the video transmitting unit(20) and the display unit (30), so that communications capability of each antenna is found based on a combination of the antennas.
